

Atlas Operations Guide

Operating guidance published before API 2.1 and the 2026-Q3 policy

Version	2.0
Authority	Operations guidance
Published	2026-04-02

This guide provides ownership and operating context. It predates newer normative materials, so API and policy claims require cross-source validation.

Ownership

The Atlas Change Service is operated by the Network Operations team.

Creating a change

The legacy guide describes PUT as the create-change HTTP method. The client retries once if the request times out.

High-risk workflow

One duty manager approval is sufficient before a high-risk change is scheduled.

Evidence retention

Execution evidence is retained for 90 days after the change completes.

Supersession notice

This guide predates the API 2.1 release and the 2026-Q3 quality policy. Newer normative sources take precedence for API and policy facts.
